

## Let's Give This Woman a Hand. After All, She Makes Great Hands.

It takes a skilled, multifaceted practitioner to create the “perfect” arm, leg or orthotic device for today’s limb-impaired patient or amputee.

These specialists oversee the process every step of the way—from designing the device, to creating it from raw materials, and finally to custom-fitting each patient for the best possible results.

It is a process that takes time, patience and caring. And it’s the most critical step in getting amputees back to living full, productive lives.

To these professionals and their patients, arms and legs are not a luxury.
